Message from the Guest Editors

Dear Colleagues,

As robot technology evolves to a level at which robots can interact with humans in their daily lives, they must be able to interact equally with people of varying abilities. Assistive Robotics is a branch of robotics which focuses on providing sensory and perception abilities and performs actions that are beneficial to the elderly and physically challenged people. This Special Issue will present the recent research advances in the field of assistive robotics that can empower people to increase independence and improve overall quality of life.

Robots for the visually impaired, telepresence robots for physical impairments, social robots for cognitive impairments, and wearable robot technologies are some of the areas of interest in this Special Issue.

We welcome original research papers that focus on fundamental research as well as experimental research on the theme of Assistive Robotics. Survey papers or tutorial papers on this topic are also encouraged.

Author Benefits

Open Access: - free for readers, free publication for well-prepared manuscripts submitted in 2017.
High visibility: indexed in INSPEC (IET) and in the Emerging Sources Citation Index (ESCI - Web of Science), from Vol. 5.
Rapid publication: manuscripts are peer-reviewed and published online approximately 25.5 days after submission; acceptance to publication is undertaken in 6 days (median values for papers published in this journal in 2016).
